Heterogeneous materials with macroscopically uniform microstructures may be modeled using either the concepts of statistical homogeneity based on representative volume element or periodicity based on repeating unit cell, Drago and Pindera , Fig. 1.In either case, these are the smallest possible volume elements which contain the necessary microstructural details such that the response of these ...

Generalized Finite-Volume Micromechanics Theory
Micromechanics of heterogeneous media plays an important role in the development of new generations of advanced material systems, enabling efficient analyses of composite materials with complex geometries, circumventing the traditional trial-and-error approach, producing substantial cost savings.

Generalized Finite-Volume Micromechanics Theory ...
The finite-volume direct averaging micromechanics (FVDAM) theory for periodic heterogeneous materials is extended by incorporating parametric mapping into the theory's analytical framework. The parametric mapping enables modeling of heterogeneous microstructures using quadrilateral subvolume discretization, in contrast with the standard version based on rectangular subdomains.

Parametric Finite-Volume Micromechanics of Uniaxial ...
This book provides the main theoretical and numerical tools to solve homogenization problems in solids with finite elements. It allows students without any preliminary knowledge on homogenization to acquire the basics and to implement the methodologies in simple programs such as Matlab.

Computational Homogenization of Heterogeneous Materials ...
Because most heterogeneous materials show a statistical rather than a deterministic arrangement of the constituents, the methods of micromechanics are typically based on the concept of the representative volume element (RVE). An RVE is understood to be a sub-volume of an inhomogeneous medium that is of sufficient size for providing all geometrical information necessary for obtaining an appropriate homogenized behavior.

In this paper, we extend the finite volume direct average micromechanics to enable the use of quadrilateral subcells. To do this work, the quadrilateral subcells are used to discretize the repeating unit cells first. Then the average displacement and traction defined on the boundary of the subcell are evaluated by direct integral method.
