Fitted mesh methods focus on the appropriate distribution of the mesh points for singularly perturbed problems. The global errors in the numerical approximations are measured in the pointwise maximum rm. The fitted mesh algorithm is particularly simple to implement in practice, but the theory of why these numerical methods work is far from simple.

Fitted Numerical Methods for Singular Perturbation ...

Using fitted operator finite difference method, we have described a numerical method for solving self-adjoint singular perturbation problems in conservation form. The method has been analyzed for convergence. Four examples have been solved to demonstrate the applicability of the proposed method.

This study introduces the uniformly convergent numerical method based on the exponential fitted operator method for solving singularly perturbed boundary value problems with integral boundary conditions. The behavior of the continuous solution of the problem is studied and the derivatives of the solution are also bounded.
