Microsoft Hyper V Powershell Automation

Manage the cluster, Hyper-V, and virtual machines from a node running Windows Server 2016 or Windows 10. You can move virtual machines between all of the nodes in the Hyper-V cluster. To use new Hyper-V features, all nodes must run Windows Server 2016 or and the cluster functional level must be updated.

What's new in Hyper-V on Windows Server 2016 | Microsoft Docs

I want to give an update to my earlier comments from Oct 06 2021. I tested again with a released version of Windows 11 (including November updates) as the host. The performance issue on AMD is still there when nesting is enabled and the guest has Hyper-V installed (no nested guest running). Also give...

Virtualization - Microsoft Tech Community

How to Install the Hyper-V PowerShell Module Using the GUI. It seems a bit sacrilegious to install a PowerShell module using a GUI, and it certainly takes longer than using PowerShell, but I suppose someone has a reason. Using the GUI to Install the Hyper-V PowerShell Module on Windows 10. Follow these steps in Windows 10:

How to Install Hyper-V PowerShell Module - Altaro

Over the course of the last year I've written a great deal about managing Hyper-V with Windows PowerShell. If you haven't started tinkering with PowerShell to see what it can do for you, take a look at my articles here and get started! As I was writing all of these articles there was a long term project I had in the back of my mind and after a period of development and testing I think I ...

Create a Hyper-V Health Report with PowerShell - Altaro

Hyper-V features, see the . Microsoft Virtualization Documentation library. The Windows Server platform uses the Hyper-V role to provide virtualization technology. Hyper-V is one of many optional roles that are offered with Windows Server. The Hyper-V role is not installed by default. Features that are typically installed at a minimum to support

Dell EMC PowerStore: Microsoft Hyper-V Best Practices

The following are the benefits of Hyper-V: Hyper-V runs each virtual machine in its own isolated space, which means you can run more than one virtual machine on the same hardware at the same time. You might want to do this to avoid problems such as a crash affecting the other workloads, or to give different people, groups or services access to different systems.
